Table 2. Monthly totals of fishing effort and salmonid harvest from the Illinois waters of Lake Michigan by charter boat anglers in 2012.
Table 3. Number of salmonids, by Lake Michigan statistical grid ${ }^{\text {a }}$, harvested by charter boat anglers in 2012. No salmonids were harvested from grids 2305, 2406, 2502, 2506, 2606, and 2703.

## List of Figures

Figure 1. Reported harvest of salmonids, by species, by charter boat sport anglers, 2002-2012. The numbers above the columns indicate the charter boat angler catch rate (number salmonids per 100 angler-hrs) in each year.
Figure 2. Fishing effort (angler-hours) by anglers fishing from shore, private boats, and from charter boats, 2002-2012. Non-charter effort estimates from Brofka and Czesny (2013).
Figure 3. Illinois charter boat and non-charter boat harvest rates for all

9 salmonids, 2002-2012. The dashed line represents the 1979-2012 average charter boat harvest rate. Non-charter harvest rate estimates from Brofka and Czesny (2013).

## Executive Summary

Illinois charter boat operator permits were issued to 109 individuals in 2012. Illinois residents accounted for approximately $81 \%$ of 19,602 sport anglers who fished on charter boats and harvested a reported 50,872 salmon and trout and 3,474 yellow perch from the Illinois waters of Lake Michigan. Coho salmon comprised the greatest portion (58\%) of the charter boat angler harvest; Chinook salmon (24\%), lake trout (11\%), rainbow trout (6\%), and brown trout (1\%) constituted smaller percentages of the harvest. The percentage of coho in the harvest was typical (1979-2012 average $65.1 \%$; range $43-83 \%$ ). The total harvest increased slightly from the previous year and effort increased slightly. The 2012 overall harvest rate ( 51 fish per 100 anglerhours) was slightly lower than the 53 fish per 100 angler-hours in 2011.

## Introduction

Non-native salmonids have become an integral part of the Lake Michigan fish community and the sport fishery. Pacific salmon and various trout species have been stocked in Lake Michigan since the late 1960s; 12.4 million salmonid fingerlings are annually stocked lakewide (10-year mean). Chinook salmon have comprised the greatest portion of salmonids stocked in Lake Michigan since 1978. Lake trout, which are native to Lake Michigan, also are stocked to meet criteria set forth by A Fisheries Management Implementation Strategy for the Rehabilitation of Lake Trout in Lake Michigan. In some years, Atlantic salmon and tiger trout also have been stocked in low numbers, and splake, a hybrid of lake trout and brook trout, were stocked in Wisconsin waters between 1984 and 2007 and Michigan waters between 1987 and 2008. Salmonid stocking in Illinois waters (Table 1) constitutes approximately $6.4 \%$ of the salmonids stocked lakewide.

The purposes for stocking these fish are to re-establish self sustaining lake trout populations and provide sport fishing opportunities. The expansion of the Welland Canal bypassed Niagara Falls which acted as a natural barrier to aquatic invaders from the Atlantic Ocean. The alewife, a fish native to the Atlantic Ocean first discovered in Lake Michigan in 1950, drastically altered the Lake Michigan food web and negatively impacted native planktivores. The original introduction of the Pacific salmon was to control alewife population growth.

Charter boat operators receive a fee to provide sport anglers access to offshore fishing opportunities for salmonids. A catch reporting system is mandated through Illinois statutes governing charter boat licensees that engage in such activities in Illinois waters (Fish and Wildlife Code of Illinois, Section 5/10-135). This report summarizes the reported charter boat
angler effort and salmonid harvest from the Illinois waters of Lake Michigan in 2012.

## Methods

Lake Michigan Charter Boat Operator permits were issued to 109 individuals in 2012. In addition, operators also received standardized catch report forms (Appendix). Data requested on the catch report included: date of fishing trip, jurisdictional grid fished, number of resident and non-resident sport anglers, number of fishing lines used, total number of hours fished (excluding running time), and number and species of harvested fish. State regulations require that charter boat operators submit these completed catch reports on a monthly basis, even in months when no charter trips occur.

Harvest and fishing effort data from 3,825 charter boat excursions were summarized by season, month, and statistical grid, and trends in harvest and effort were compared between years. These harvest data represent reported fishing effort by 15,929 Illinois residents and 3,673 nonresidents that chartered boats to fish in the Illinois waters of Lake Michigan in 2012. Since the number of fishing lines per angler was not equivalent among trips, fishing effort was instead expressed as angler-hours and calculated by multiplying the total number of anglers by number of hours fished. Seasonal harvest rate was calculated by dividing the total harvest of all salmonids by total effort for the season. Harvest rate for each statistical grid was based on total number of salmonids harvested within the grid divided by the fishing effort within the grid. All harvest rates were then standardized to 100 angler-hours because harvest rates were typically less than 1 fish per angler-hour.

## Results and Discussion

Similar to previous years, most salmonids harvested from Illinois waters of Lake Michigan in 2012 were coho salmon (Figure 1). Coho salmon accounted for 58\% of the 2012 salmonid harvest and have comprised the greatest portion $\left(65 \%^{1}\right)$ of the salmonid harvest since 1979. The percentage of coho in the harvest was less than in 2011 (65\%). Lake trout (11\%), rainbow trout ( $6 \%$ ), and brown trout ( $1 \%$ ) constituted smaller percentages of the 2012 harvest. Both the number harvested and the percentage of Chinook salmon in the harvest increased compared to 2011. Harvests of Chinook salmon, lake trout, and brown trout increased between 2011 and 2012; harvests of coho salmon and rainbow trout declined.

Charter boat angler effort (98,891 angler-hours) increased slightly from 2011 (95,376 angler-hours). Non-charter salmonid fishing effort increased by $20 \%$ between 2011 and 2012. Charter boat sportfishing accounted for approximately $21 \%^{2}$ of the total fishing effort directed at salmonids in the Illinois portion of Lake Michigan prior to 1999. More recently, charter boats have comprised $29 \%^{3}$ of the total angler effort for salmonids, due to a slow decline in shorebased salmon fishing since 1988 and declines in non-charter boat effort since 1998 (Figure 2). Overall harvest rate was highly influenced by the number of coho salmon in the harvest. There was a decrease in harvest rate from 53 fish per 100 angler-hours in 2010 to 51 fish per 100 angler-hours in 2012 due to a slight decrease in the harvest of coho salmon. Similar to previous years, the harvest rate of anglers fishing on charter boats was approximately twice that of anglers fishing on non-chartered boats (Figure 3).

[^0]Most chartered fishing trips typically occur during the months of May and June (Table 2).
The spring coho season, as typical, was extended into June; most coho salmon (46\%) were harvested in May. Chinook salmon harvest was nearly evenly spread across May through August. Data from previous years indicated that coho salmon harvests are usually highest in spring, while other salmonids are more equally represented in the late-summer harvests. Catches, adjusted for effort, of other salmonids were variable throughout the fishing season.

No fishing was reported in five statistical grids (2305, 2406, 2502, 2506, 2606, and 2703). Approximately $54 \%$ of the salmonids were harvested from Grid 2302 however $49 \%$ of the fishing effort was focused in that grid (Table 3). The highest harvest rate (125 fish per 100 angler-hrs) occurred in Grid 2405 however only 5 fish were harvested from that grid in a single charter trip (4 angler-hrs). In general, harvest rates are usually highest in the north and in grids closest to shore (i.e., 2302 and 2402). In addition to the typically high catch rate in grid 2302 (57 fish / 100 angler-hours) during 2012, higher catch rates were observed in offshore grids (e.g., 2304, 2403, 2404, 2504, and 2604).

| Prepared By | Date Prepared |
| :--- | :--- |

The Illinois Department of Natural Resources is requesting disclosure of information that is necessary to accomplish the statutory purpose as outlined in the Fish Code of Illinois, Section 5/10-135. Disclosure of this information is required by law. Failure to provide such information could result in the denial of future charter boat permits under Section $5 / 20-35$. This form has been approved by the Forms Management Center. Information given on this report is confidential and no information revealing private enterprise will be given out.
Reports must be submitted for EACH month (March through November) and received on or before the $15^{\text {th }}$ day of the following month, whether fishing occurred or not.
When no more fishing will occur for the season, the report must be submitted stating "NO MORE FISHING FOR CURRENT YEAR", and reports will NOT have to be submitted for subsequent months.

## INSTRUCTIONS FOR PREPARING REPORT

CHARTER BOAT OPERATOR PERMIT NUMBER - Enter your current Illinois operator permit number.
PORT - Enter the port of your departure.
MONTH - Name of the month (and year) for which the report is being prepared.
DATE - Enter the date on which the fishing occurred. Use a separate line for each trip.
LOCATION BY GRID NUMBER - Refer to the lake chart below and determine the number of the grid in which most of the fishing was done. Enter this number in the space provided.
NUMBER OF ANGLERS, RESIDENT AND NON-RESIDENT - Enter the number of Illinois residents and non-resident anglers in the fishing party and include crew members if they fished.

NUMBER OF LINES - Enter the number of lines being fished from the boat.
HOURS FISHED - Enter the number of hours in which the party was engaged in fishing. Do not include running time.
CATCH DATA - Enter the number of fish of each species kept during the trip. Enter the color and number on any tags observed on those fish caught during the trip.

Preparer of form must sign and date on the bottom of the form in the space provided.
