

LAKE STOREY

FISHERIES STATUS SUMMARY

LOCATION:

Lake Storey is located in Knox County at the northwest edge of Galesburg with access to the lake off of U.S. Route 150.

DESCRIPTION :

Lake Storey is a medium sized watershed type impoundment owned by the City of Galesburg and managed for fishing by the Illinois Department of Natural Resources.

Lake Storey is 132.5 acres in size and has a maximum depth of 32 feet. It has a shoreline length of 5.8 miles and is 1.5 miles in length from east to west. A boat ramp and parking lot is provided on each end of the lake. Other facilities provided at Lake Storey Park include: camping, swimming, golf, picnic areas and a 2.65 mile paved trail.

Lake Storey was constructed in 1928-29 by the Atchison, Topeka and Sante Fe Railroad as their water supply reservoir. In 1952, the lake and surrounding land was gifted to the City of Galesburg for the development of Lake Storey Park.

MANAGEMENT ACTIVITIES:

The lake and its sport fishery are evaluated annually by spring trapnetting and a fall electrofishing survey. These surveys direct fish stockings, fish regulations and aquatic vegetation treatments.

The waterlevel at Lake Storey is drawn down annually 5 to 6 feet in early September as a major fish management practice. The annual fall drawdown increases the predation of small fish, which enhances the growth rates of both predator and prey species.

Largemouth Bass:

In 2018, spring trapnetting and fall D.C. electrofishing were used to survey the fish population. The largemouth bass population was evaluated by 355 bass from electrofishing.

The largemouth bass population appears to be defined by a high percentage of fish from 3.5 to 17 inches in length with good average Relative weights. In 2017, the bass regulation for Lake Storey was changed from a 1 fish greater than or equal to 15 inches and/or 5 fish less than 12 inches daily, to a protected slot length limit from 12 to 18 inches with 3 fish daily harvest limit. The goal of the new bass regulation is to increase the density of the bass population from 14 to 18 inches.

The 5 year averages from 2011 to 2015 were RSD15 of 21, RSD16 of 12, and RSD18 of 3. And a 5 year average CPUE 2.1 fish per minute over 8 inches with pulse D.C. eletrofishing.

The 2017 electrofishing survey indicated a size structure that was at a PSD of 52, RSD15 of 9, RSD16 of 6 and the RSD18 of 3. The average body condition was at a Wr of 101.

In 2018 the values were at a PSD of 43, RSD15 of 8, RSD16 of 3 and the RSD18 of 2. The average body condition was at a Wr of 101.

The goal of the protected slot length limit is to create a high density bass population that is composed of fish large enough to be efficient predators upon the panfish population. The benefit to bass anglers will be

more fish surviving past 15 inches to catch, and for the anglers wanting to harvest bass will be the opportunity to still harvest fish under 12 inches. The current indice levels will need to be evaluated over the next 3 years to determine if progress is being made to increase the number of fish from 15 to 18 inches in length.

Bluegill:

The bluegill population was sampled by 43 fish in spring trapnets and 9320 fish in fall electrofishing survey. The current bluegill population is rated as average with the larger fish up to 7.5 inches in length. This population is of moderate density and in good body condition with a Wr average of 94.

Redear Sunfish:

The redear sunfish population was sampled by 0 fish in spring trapnets and 38 fish in fall electrofishing survey. The current redear population is rated as average with the larger fish up to 10.1 inches in length. This population is of low density and in good body condition with a Wr average of 98.

Crappie:

The white and black crappie populations have been an average rating in recent years. The 5 year averages from 2011 to 2015 were an RSD10 of 35 for white crappie and an RSD10 of 1 for black crappie. The black crappie population has become the dominant species. The 5 year trapnet catch per unit of effort was 17.9 black crappie per net night and 1 white crappie per net night.

In 2018, the white crappie population was sampled by 2 fish in spring trapnets and 8 fish in fall electrofishing survey. The black crappie population was sampled by 23 fish in spring trapnets and 71 fish in fall electrofishing survey. 10 stock size white crappie were sampled with a PSD of 90, RSD9 of 70, RSD10 of 70, and RSD11 of 40. 94 stock size black crappie were sampled with a PSD of 72, RSD9 of 5, RSD10 of 2 and RSD11 of 1. Both species had average WR values of 88 and 91. These indices have all been steady the last 6 years. Anglers can continue to apply harvest pressure upon the dense black crappie population that is from 7.5 to 9 inches in length.

Walleye:

The walleye population was sampled by 13 fish in spring trapnets and 34 fish in the fall electrofishing survey. The current walleye population is rated as good with the larger fish up to 28 inches in length. The CPUE for trapnets was at .7 fish per net night in 2018. This population is of moderate density and in average body condition with a Wr average of 89. Jake Wolf hatchery stocked 6696 fish at 1.5 inches long in 2016. No walleye were stocked in 2017 or 2018.

Muskie:

A total of 31 muskie were sampled by the spring trapnet survey in 2018. These fish ranged from 28 to 46.5 inches long. The body condition of these fish was good at an average Wr of 92. A moderate density of quality size muskie are present. 43 muskie have been recaptured with PIT tag data from Lake Storey since 2002. The 2014 recapture growth rate for a male over 10 years old was .21 inches and .26 lbs per year. And the growth rate for 2 females over 10 years old was 1.1 inches and 1.40 lbs per year. Jake Wolf stocked 136 muskie at 10.75 inches in 2016. Jake Wolf stocked 135 at 12.5 inches in 2017, and 136 fish at 12.5 inches in 2018. An annual stocking is now scheduled to maintain a moderate density of healthy muskie.

Channel Catfish:

The channel catfish population was sampled by 3 fish in spring trapnets and 16 fish in fall electrofishing survey. The current channel catfish population is rated as good with the larger fish up to 36 inches in length. This population is of moderate density and in good body condition with a Wr average of 93. Little Grassy hatchery stocked 3990 fish at 7 inches in 2018.

Other Species:

6 carp, 5 golden shiners, 2 green sunfish, 3 bluegill x green sunfish hybrid, 2 bluegill x redear sunfish hybrid and 1 yellow bullhead were also sampled in 2018. These species have been maintaining a low density in the recent past in Lake Storey.

Fishing Regulations:

All Fish - 2 pole and line fishing only.

Large or Smallmouth Bass:

- Protected Slot Length Limit from 12 to 18 inches with 3 fish daily harvest limit.

Bluegill or Redear Sunfish:

- 25 fish Daily Harvest Limit.

Pure Muskellunge:

- 42 inch minimum length limit with 1 fish daily harvest limit.

All fish:

- 2 Pole and line fishing only.

Channel Catfish or Blue Catfish:

- 6 fish daily harvest limit.

Walleye, Sauger, or Hybrid Walleye:

- 3 fish daily harvest limit.

Recreational Use Restrictions:

- All live bait greater than 8 inches must be rigged with a quick set rig.

- No gas motors to propel watercraft, electric motors only.

-Swimming is permitted only in designated area when lifeguard is on duty.
