

# JOHNSON LAKE BANNER MARSH STATE FISH AND WILDLIFE AREA FISHERIES STATUS SUMMARY

**LOCATION and DESCRIPTION:** Located in Central Illinois, the 5,524 acre Banner Marsh State Fish and Wildlife Area lies adjacent to the Illinois River, 4 miles north of Banner, Illinois, along Route 24. The former bottomland lake and marsh was leveed and drained for agricultural practice from 1910 through 1958. From 1958 to 1974 approximately 90 percent of the site was strip-mined for coal. The strip-mined areas have since been reclaimed and purchased by the State of Illinois. Under the management of the Illinois Department of Natural Resources (1978 - present) the primary objective for the site is to establish a freshwater marsh providing fish and wildlife habitat in the Illinois River Valley.

Banner Marsh SFWA was characterized by narrow strip pits and upland ponds, but in 1994 the hydrology changed due to the intentional cessation of pumping operations in the levee district. The water level rose approximately 7 feet (435 M.S.L.) due mainly to groundwater recharge by seepage under the existing 1-100 year flood-tight levee with the Illinois River. The total surface water acreage for the site increased from 530 acres to approximately 2400 acres and created a large vegetated littoral zone.

**Johnson Lake** is the largest lake in the Banner Marsh SFWA at over 600 surface acres.

It is composed of a maze of final cut lakes interconnected by ditches to large shallow pond areas. The shallow areas (less than 6 feet) compose approximately 400 acres of flooded brush and diverse aquatic vegetation. The maximum water depth is 64.0 feet. Water clarity often exceeds 8 feet in the summer.

The main access area has a concrete boat ramp, 50 vehicle and trailer parking lot, restrooms and a handicap accessible fishing pier. The lake has a 25 h.p. motor limit. The site is open 24 hours a day, except for the Central Zone Duck Season. At which time only shoreline fishing is allowed after 1 p.m.

## **HISTORY & STATUS of the SPORT FISHERY:**

**Largemouth Bass:** In 2018, spring trapnetting and fall D.C. electrofishing were used to survey the fish population. The largemouth bass population was evaluated by 156 bass from electrofishing with 108 minutes of effort.

The largemouth bass population appears to be defined by a high percentage of fish from 5.1 to 21 inches in length with good average Relative weights. In 2000, the bass regulation for the Marsh was changed from a 14 inch minimum size limit and 1 fish per day - to a 12 to 18 inch protected slot length with a harvest of 3 fish under or over the slot per day.

The 2018 electrofishing survey indicated a size structure that has maintained a consistent level since 2007. The PSD of 79, RSD14 of 54, RSD16 of 36 and the RSD18 of 15 are very good and consistent over the past four years. The average body condition was at a Wr of 95 and the growth rate was good.

**Bluegill:** The current bluegill condition is of a poor state with a poor growth rate. The competition with the gizzard shad and carp have maintained this growth slowdown.

**Crappie:** In 2018, 3 stock size black crappie were sampled with a PSD of 67, RSD9 of 0. 2 white crappie were sampled with a PSD of 100, RSD9 of 100 and RSD10 of 100. Both species had average WR values of 79 and 92. The body condition of both populations had decreased over the last 6 years. In 2018 the crappie harvest regulation changes to a harvest limit of 25 fish per day with only 10 fish over 10 inches allowed. Anglers should be able to concentrate on crappie with the flooded brush providing excellent habitat.

**Channel Catfish:** The channel catfish population was sampled by 7 fish in 2018. These fish ranged in size from 11.4 to 26.4 inches and were in excellent body condition. A low density population is present and an annual stocking of 500 to 600 fish is scheduled. 657 fish were stocked in 2018.

**Walleye:** The walleye population trapnet sampling in 2018 resulted in 4 total fish in 8 net nights of effort (.5 per net night). These fish ranged from 23.2 to 30.5 inches long. The body condition of these fish was very good at an average Wr of 115. At this time the stocking of 2 inch walleye may have variable recruitment to the lake’s walleye population. In 2016 through 2018, over 24,000 walleye at 1.8 inches were stocked each year.

**Muskie:** A total of 29 stock size muskie were sampled by the spring trapnet survey in 2018 and 6 in the fall electrofishing survey. These fish ranged from 21 to 42.5 inches long. The body condition of these fish was average at an average Wr of 85. In 2001, a total of 2,174 muskie at an average size of 11.4 inches were stocked, in 2002, 725 muskie at an average size of 10.9 inches were stocked and in 2003, 1333 muskie at an average size of 10 inches were stocked into Johnson Lake. No muskie were stocked in 2004, but 600 at 10 inches long were annually from 2005 through 2014. No muskie were stocked in 2015 or 2016. In 2017, 602 fish at 12.4 inches were stocked. A triennial stocking is now scheduled to maintain a moderate density of healthy muskie.

<b>FISHING REGULATIONS:</b> Site specific angling regulations. Two pole and line fishing only except carp may be taken by bow and arrow devices, gigs or appears during May through August, all other statewide regulations apply.	<b>Daily Creel Limit</b>	<b>Minimum Length Limit</b>
<b>All Fish</b>		<b>2 pole and line only</b>
<b>Largemouth/Smallmouth Bass</b>	<b>3</b>	<b>12-18" protected slot length</b>
<b>Channel Catfish</b>	<b>6</b>	<b>None</b>
<b>Walleye</b>	<b>6</b>	<b>14" minimum</b>
<b>White and Black Crappie</b>	<b>25</b>	<b>With only 10 fish over 10"</b>
<b>Muskie</b>	<b>1</b>	<b>42" minimum</b>
